# Superlock

SUPERLOCK II Software

Description

Superlock II is a program for planning, calculation and administration of Master Key Systems (MKS) and has been developed with the latest programming tools, so that it is compatible with the latest Windows versions (32 and 64 bit). Superlock II can read and import lock systems from earlier program versions, such as Planner and Superlock 16 bit. When upgrading from an earlier Superlock for Windows, you can import all existing lock systems into the new Superlock II.

Superlock II is an ideal high quality tool for professional key and lock manufacturers, calculating key cutting and cylinder pinning in systems with either single or multiple profiles. With Superlock you can setup your own profile sets and make Superlock assign the profiles to each key and cylinder. You can also type in key codes manually or leave it to Superlock to calculate them, automatically, as well as having the ability to plan a later extension, make new extensions or recode existing lock systems.
