

BORG LOCKS BL5400 ECP Retrofit Cu-Shield ECP Antimicrobial Digital Lock Cover

Description

The BL5400 Cu ECP Retrofit copper-touch cover is retrofitted over existing BL5400 ECP digital locks. Comprising an antimicrobial copper alloy keypad shield and handle, the BL5400 Cu ECP Retrofit offers an additional layer of protection on high-risk touch surfaces and helps to control the spread of viruses and pathogens without the cost of buying brand-new digital keypad locks.

Please note, the BL5400 Cu ECP Retrofit kit does not come with the keypad itself and is designed to be used over an existing BL5400 ECP digital keypad lock already on site.

Control the spread of viruses and pathogens on high-risk touch surfaces, such as door locks, keypads and handles with the Cu-Shield range of digital door locks. This is a copper-touch digital lock cover, forged and machined from a high content copper alloy (at least 60% Cu content), tested to ISO 22196:2011. Copper alloy is known to kill viruses rapidly upon contact, between touches and between cleans. It also offers long term antimicrobial performance that last the lifetime of the product.

Whilst having the look of brushed brass, the high copper content of the Cu-Shield means that it significantly and continuously reduces the microbial loading on touch surfaces in between existing cleaning episodes. The Cu-Shield will retain its rapid kill properties against known pathogens, despite natural oxidation, which may occur over time.

Features

- To suit BL2700 ECP series Borg Locks
- Fits over existing digital lock
- Solid copper-alloy surfaces
- Lifetime antimicrobial protection
