Description

The ADA2100 dongle is a timesaving solution for programming certain Volvo slot and proximity keys. It connects directly to the vehicle OBD socket to read the security data from the vehicle ECU, and stores the reading session. This means that if interrupted it will resume from where it was last read and as no data is lost the job can be done in several sessions. LED's on the dongle will indicate when the security reading is complete and it is then ready to be connected via USB to a Smart Pro machine to transfer the security information. The key programming procedure is then completed by following the guided process in Smart Pro.

Features

- No data lost during reading session

- Connects directly to the vehicle OBD socket to read the ECU data

- LED status indication

- Once complete connect to Smart Pro via USB
