

Description

The Paxton Proximity Long Range Reader 313-110 is an RFID hand free access control device operated by token. It is ideal for use with car park access points as its long 5 metre range means that access can be granted from within a car or van. The hands free interface eliminates the need to lay ground loops during installation, and it can also be used as a close proximity reader so that authorised users without hands free tokens can still gain access. This reader features a durable black casing with a highly visible LED display that lights up with red to indicate denied access, and green to indicate authorised access. Additionally, it also emits an alert tone when access is granted or denied.

IP66 Ingress Protection
Rating

UK Manufactured

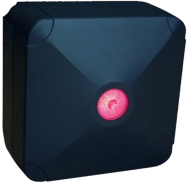

Weather Resistant
