

THE DIAGNOSTICS BOX TDB006 Antenna Tester

Description

THE DIAGNOSTICS BOX TDB006 is a test device for checking the antenna used on transponder key systems and is full of features. It has an internal antenna with high gain receiver to receive the antenna signal and it also has an external antenna `wand` connection to connect a wafer thin antenna for testing the push start, card slots and smart key types.

The external wand can slide into the key or card reader as well as the key, easily picking up the signal being sent from the vehicle. When a key or card is inserted, the vehicle sends a signal to the transponder inside the key and the TDB006 will pick up this signal to confirm that the slot key or card reader is functioning correctly.
